

MiDataHub – UIC API Process

1. SIS sends student core data and whether or not to auto-create a UIC if none found (permission-based) typically within
2. Identity API formats the request and sends to plug-in
3. Request for UIC plug-in calls the appropriate service to send to CEPI
4. CEPI UIC Service – returns an exact match, potential matches, or a new UIC
5. Identity API returns the results to the SIS
